1. Introduction

1.1. The purpose of this guidance

In September 2023, the TNFD published its recommendations for disclosure of nature-related issues and supporting implementation guidance. This document provides sector-specific additional guidance for the construction materials sector, covering:

- The assessment of nature-related issues using the TNFD's LEAP approach (Section 2); and
- The disclosure of sector-specific metrics in line with the TNFD's recommended approach to metrics (Section 3).

The TNFD's [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#) is designed as an iterative process – across business locations and business lines – in line with established risk management processes and corporate reporting cycles. Organisations may choose to start with a narrow scope for a LEAP assessment, and gradually expand the scope of the assessment as they gain experience and insight.

The TNFD recognises that there can be significant differences across sectors for corporates applying the LEAP approach. It has published this additional guidance with significant input from a range of knowledge partners and market participants, to help construction materials sector participants apply the LEAP approach to their context. The overall structure of the LEAP approach is set out in Figure 1. This guidance follows that structure and Table 1 sets out the elements of LEAP for which this document provides additional guidance.

The Taskforce also recognises that investors and other stakeholders require quantitative information to compare performance and nature-related issues within sectors. To facilitate that sector-level analysis, this guidance also includes:

- Guidance on the application of the core global disclosure indicators and metrics to the construction materials sector (Section 3.1); and
- Core and additional sector disclosure indicators and metrics (Sections 3.2 and 3.3).

Figure 2 provides an overview of the TNFD disclosure measurement architecture and where indicators and metrics are listed in the [TNFD recommendations](#) and relevant sector guidance.

Figure 1: The TNFD approach for identification and assessment of nature-related issues – LEAP

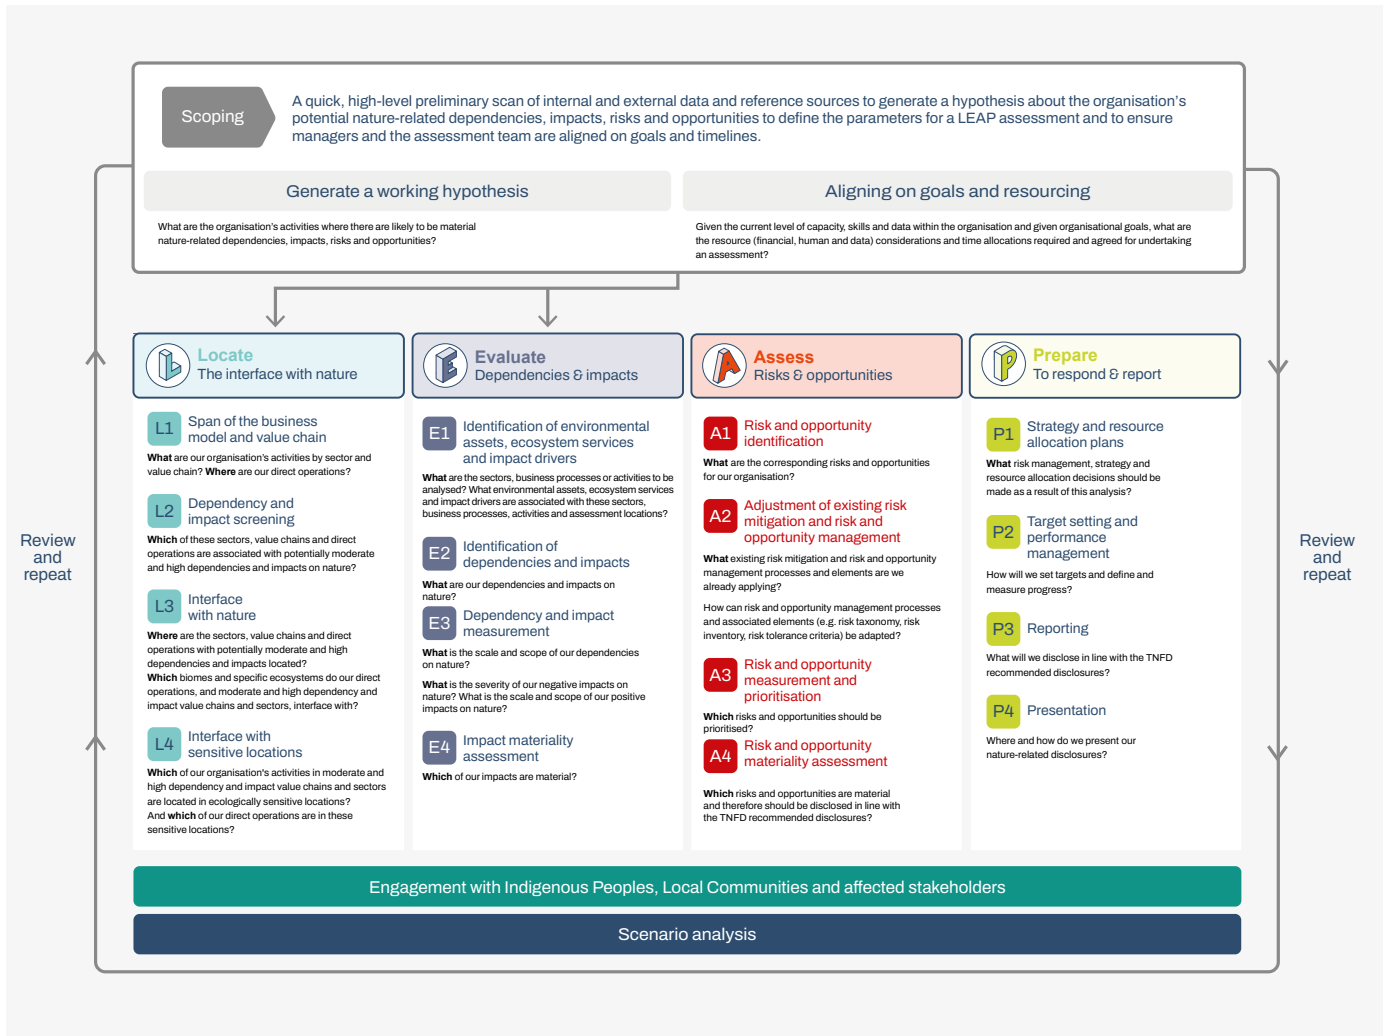

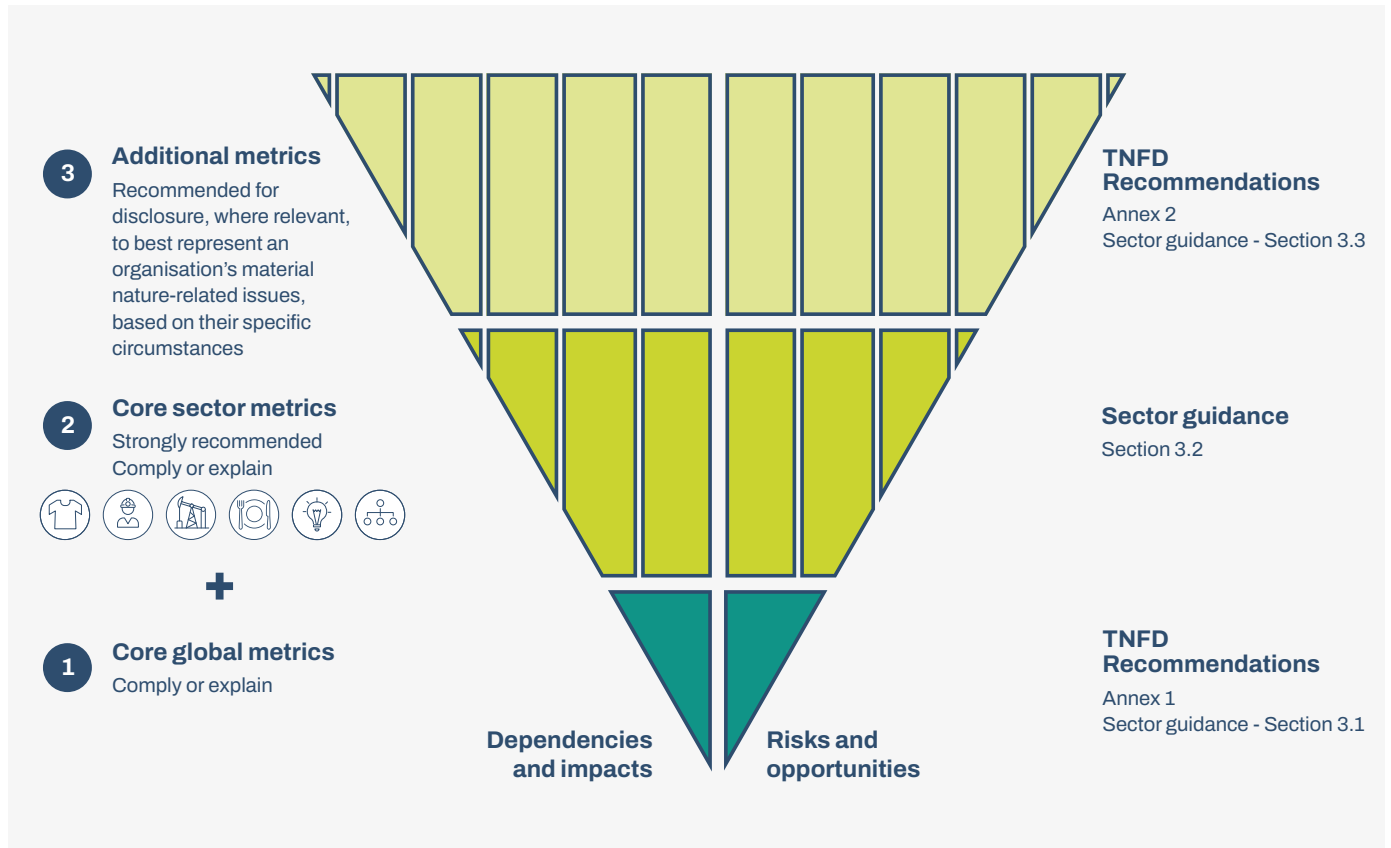

Figure 2: TNFD disclosure metrics architecture signposted to metrics lists

The guidance in Section 3 on the application of the TNFD core global metrics for this sector, as well as the core and additional sector metrics outlined, expand on the disclosure indicators and metrics outlined in Annexes 1 and 2 of the [TNFD recommendations](#). The TNFD has incorporated and sought to build on existing industry standards and disclosure metrics wherever possible to build on current data collection and reporting practices and minimise additional assessment and reporting costs.

1.2. Audience for this guidance

This guidance covers those organisations with business models or value chains in the Sustainable Industry Classification System (SICS®) Construction Materials industry (Box 1).¹ These are referred to as ‘construction materials organisations’ in this guidance.

Box 1 : SICS® industries in the scope of this guidance document

Construction Materials (EM – CM)

¹ SASB (2018) [SASB's Sustainable Industry Classification System \(SICS\)](#).

Under the Sustainable Industry Classification System (SICS®) developed by the Sustainability Accounting Standards Board (SASB), Construction Materials fall under the Extractives and Mineral Processing sector. In this classification:

- Construction materials entities have global operations and produce construction materials for sale to construction entities or wholesale distributors. These primarily include cement and aggregates, but also glass, plastic materials, insulation, bricks and roofing material. Materials producers operate their own quarries, mining crushed stone or sand and gravel. They may also purchase raw materials from the mining and petroleum industries.²

This guidance focuses on cement and aggregates.

The guidance is a supplement to the TNFD’s [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#) and should be read in conjunction with that guidance. Organisations in the construction materials sectors should also refer to the [TNFD biome guidance](#) and [Guidance on engagement with Indigenous Peoples, Local Communities and affected stakeholders](#).

The examples provided in this guidance for the construction materials sector are intended to be illustrative. They are not exhaustive, universally applicable or recommended by the TNFD as examples of measures for all organisations within the industry. Each company’s context, location and nature-related interactions are unique. The TNFD encourages all companies to consult additional relevant sources, including scientific references and relevant industry standards or best practice guides, and conduct thorough assessments to identify and assess nature-related dependencies, impacts, risks and opportunities specific to their operations and value chains. This guidance aims to support, not replace, a tailored assessment, which will be necessary for each organisation.

² SASB Standards (2023) [Construction Materials](#).

Note: Companies producing wood-building products are included in the building products and furnishings (CG-BF) industry, forestry management industry (RR-FM), and pulp and paper products industry (RR-PP) under the Sustainable Industry Classification System (SICS) and are not included in the SASB Construction Materials standard. Organisations in these industries should refer to the [TNFD sector guidance for forestry, pulp and paper](#).

2. Sector-specific LEAP assessment guidance

2.1. Scoping a LEAP assessment

Working hypothesis generation

What are the organisation's activities where there are likely material nature-related dependencies, impacts, risks and opportunities?

In creating initial hypotheses, organisations should bear in mind that nature-related dependencies, impacts, risks and opportunities will vary across the quarry lifecycle and across the lifecycle of the products extracted and produced. The scope of analysis for quarries should include the quarry itself but also:

- Other land owned or leased by the organisation on the site, including the non-quarried area;
- Buffer zones;
- Areas of rehabilitation or reclamation and reserved areas;
- Access roads, conveyor belts and transport routes that may contribute to habitat fragmentation or disrupt animal movement or migration, or disturb ecologically sensitive areas; and
- Wider areas linked to the site by ecological processes and environmental features such as rivers and streams.³

Scoping should not be limited to extraction from quarries, but also the extraction of other materials such as sand, manufacturing and downstream activities such as construction.

Organisations may want to consult existing quarry environmental impact assessments and rehabilitation or reclamation plans, and product lifecycle analyses to support development of hypotheses for nature-related dependencies, impacts, risks and opportunities.⁴

³ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

⁴ GCCA (2023) [A commitment to biodiversity by the cement and concrete industry](#).

Value chain considerations when scoping

Construction materials organisations may operate across many different sites and have many different suppliers and consumers across their value chains with significant potential nature-related dependencies and impacts.

Construction materials organisations may therefore choose to start with a narrow scope, such as a selection of high priority sites or areas of the value chain where material nature-related dependencies, impacts, risks and opportunities are most likely to arise. The LEAP approach is designed as an iterative process, in line with established risk management processes and corporate reporting cycles, and organisations should expand the breadth and depth of the assessment over time as they gain experience and maturity in applying the process. Further guidance is available in the [TNFD guidance on value chains](#).

Construction materials organisations may find it useful to consider:

- New and any existing effective ways of interacting with upstream and downstream partners along the value chain in order to obtain the required nature-related information; and
- Partnering with other construction materials organisations to understand nature-related dependencies, impacts, risks and opportunities within the value chain.

Organisations should also refer to the [TNFD sector guidance](#) for the forestry, pulp and paper, engineering, construction and real estate sectors, as well as any other relevant sectors in the value chain.

Goals and resource alignment

Given the current level of capacity, skills and data within the organisation and given the organisational goals, what are the resource (financial, human and data) considerations and time allocations required and agreed for undertaking an assessment?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

2.2. Locate the organisation's interface with nature

This section provides additional guidance to help construction materials sector organisations with the Locate phase of the LEAP approach.

L1: Span of the business model and value chain

Guiding questions:

What are our organisation's activities by sector, value chain and geography?

Where are our direct operations?

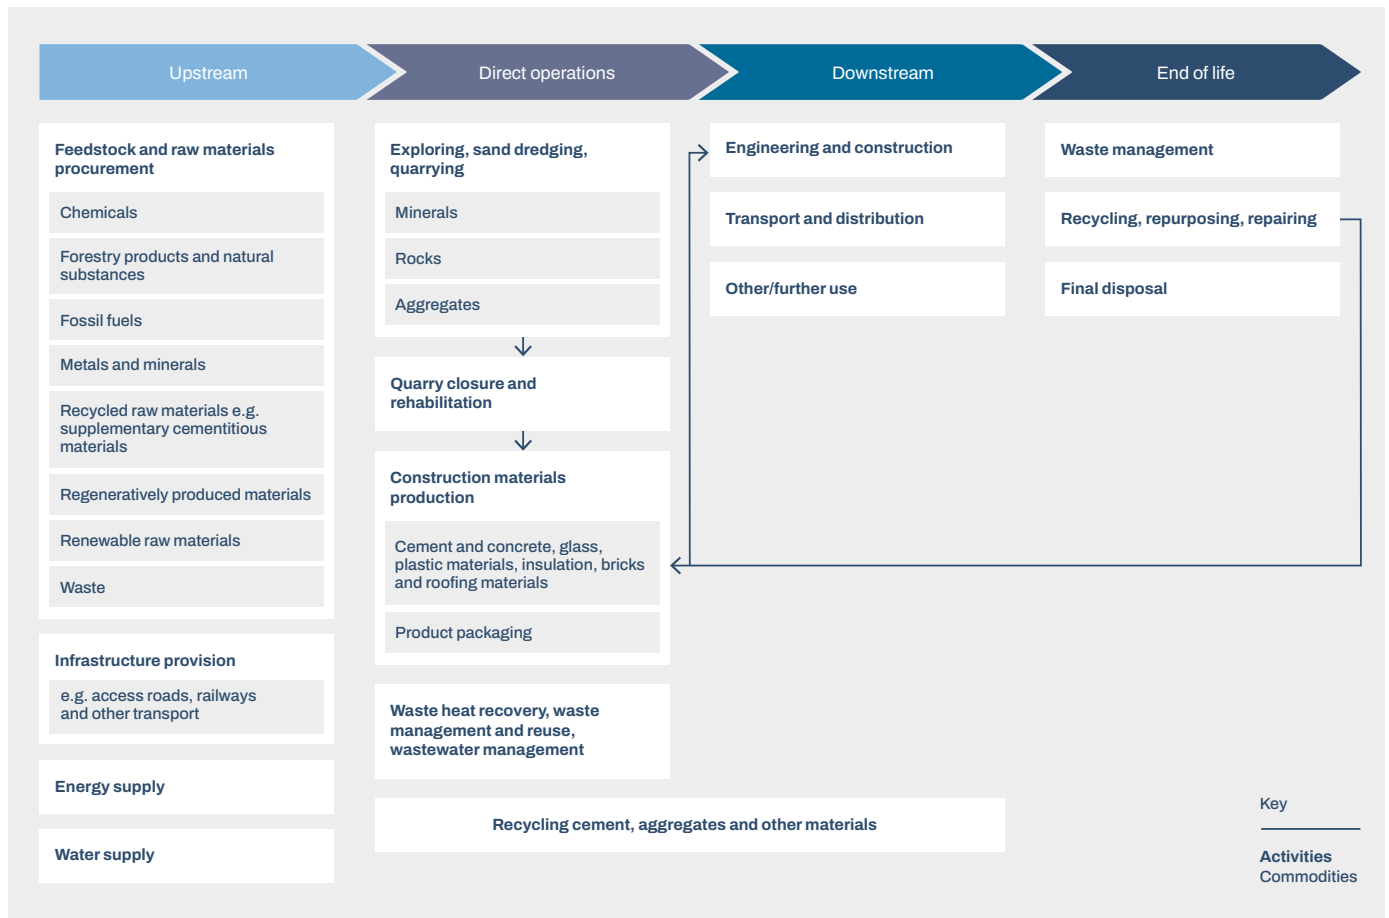

The construction materials value chain

Figure 3 illustrates the typical activities and commodities across the value chain that construction materials organisations should consider as part of their value chain mapping. The TNFD recognises that the activities that are part of direct operations, upstream or downstream for an individual company will vary depending on its specific business.

When mapping out the value chain, organisations should include the full lifecycle of their quarries – including closed and/or exhausted quarries, sites reserved for future use and temporarily dormant quarries⁵ – as well as any processing and manufacturing activities in direct operations, and the full lifecycle of the materials produced.

⁵ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

Figure 3: Typical business activities in the value chain of the construction materials sector

Locating direct operations

When identifying the location of direct operations, organisations should strive to move beyond point coordinates to polygons of quarries, other material extraction sites and manufacturing plants. Where possible, organisations should also include:

- Notional and ecologically determined buffer zones of at least 500m from the site boundary;⁶
- Areas of rehabilitation or reclamation and reserved areas;
- Access roads, conveyor belts and transport routes that may contribute to habitat fragmentation or disrupt animal movement or migration, or disturb ecologically sensitive areas;

⁶ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#). The guidance on how to use the Species Threat Abatement and Restoration (STAR) metric recommends applying “a sufficiently large buffer (e.g. 50km) around the perimeter of an Area of Interest.” IBAT (2021) [Species Threat Abatement and Restoration \(STAR\) data layer: Business User Guidance](#).

- Wider areas ecologically and physically connected to the site, for example, through environmental features such as rivers and streams, wider river basins, oceans or forest ecosystems as appropriate; and
- The wider landscape, to allow evaluation and assessment of nature-related dependencies, impacts, risks and opportunities within that landscape and comprehensive stakeholder engagement.⁷

Organisations should iterate this work with analysis in the Evaluate phase to understand how nature-related dependencies and impacts can arise beyond the site boundary. Box 2 provides further guidance on identifying the area of influence of a site for the purposes of a LEAP assessment.

Box 2: Area of influence

Nature-related dependencies and impacts can arise beyond the boundary of an organisation's site as a result of ecological processes and flows that link the site with the wider landscape and beyond. These linkages result in an 'area of influence' (see Figure 4). A site's area of influence is generally larger than the physical footprint of the project itself and includes the area within which a project may potentially directly, indirectly and cumulatively cause impacts or have dependencies on nature.

The size of the area will vary depending on the organisation's activities and/or assets, and the biome where it is operating, but will usually be much larger than the site itself (see Figure 4). The area will include:

- Locations where the organisation has an impact beyond the site boundary, for example, where the movement of aggregates from the quarry to another location inadvertently introduces invasive species to another ecosystem; and
- Environmental assets on which the organisation directly or indirectly depends, such as the supply of clean water from a river that originates in a lake that is being polluted by the activities of other actors upstream.

Construction materials organisations should pay particular attention to karst formations, where ecological and hydrological connections may be particularly complex,⁸ and to sand extraction from rivers, which can alter freshwater and sediment discharge downstream and affect delta formation.⁹

⁷ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

⁸ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

⁹ Jordan, C. et al. (2019) [Sand mining in the Mekong Delta revisited – current scales of local sediment deficits](#).

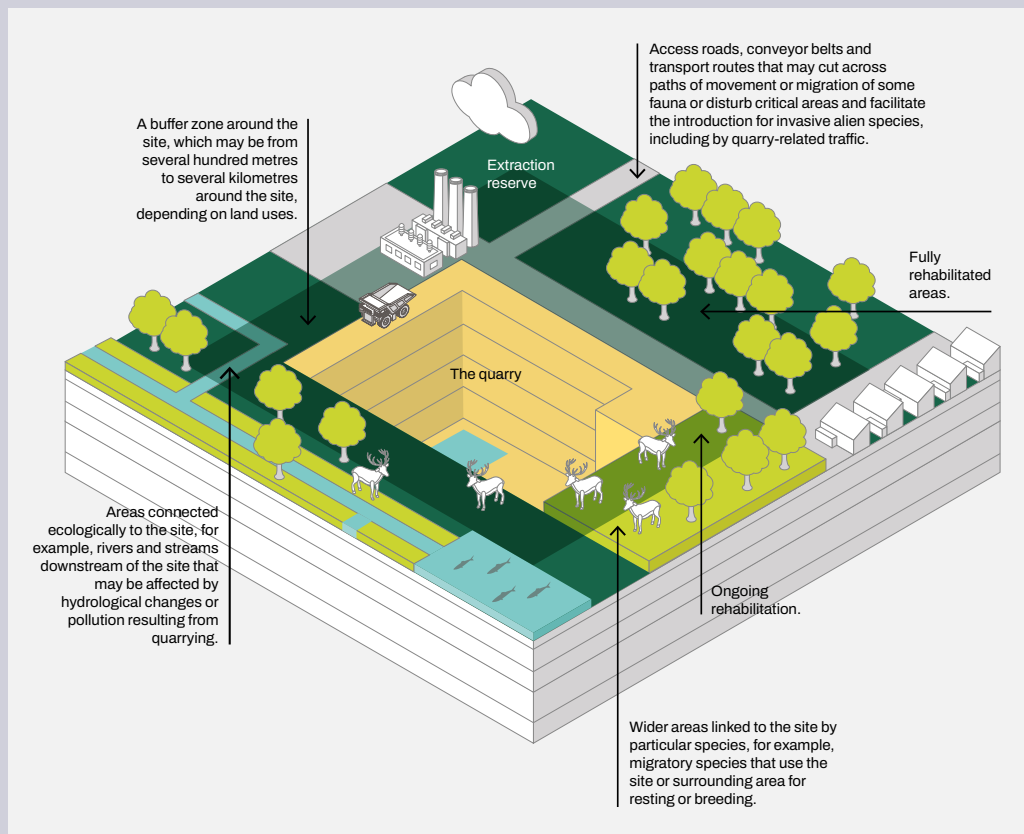

External factors and cumulative effects should also be considered, for example resulting from the activities of other organisations with overlapping areas of influence, policies and economic conditions generated outside the landscape, land use in neighbouring landscapes and remote physical features (e.g. dams).

Engagement with Indigenous Peoples, Local Communities and affected stakeholders can provide further insights, and organisations may find it useful to refer to the TNFD's [Guidance on engagement with Indigenous Peoples, Local Communities and affected stakeholders](#).

A comprehensive approach to outlining a project's area of influence is included in good practice guidelines such as [IFC Performance Standard 6](#).

Figure 4: Ecological connections between a quarry site and the wider landscape

Source: IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

L2: Dependency and impact screening

Guiding question:

Which of these sectors, value chains and direct operations are associated with potentially moderate and high dependencies and impacts on nature?

In L2, organisations should filter the list of upstream and downstream activities and commodities identified in L1 to prioritise which should be considered for further analysis.

Tables 2 and 4 provide the ENCORE materiality ratings for impact drivers and ecosystem services associated with construction materials activities. Table 3 provides the typical impact drivers associated with construction material commodities identified by Science Based Targets Network (SBTN) as associated with high impacts on nature. Construction materials organisations should refer to the associated [TNFD sector guidance](#) and ENCORE materiality ratings for screening activities in other value chain sectors where available (e.g. transport).

Construction materials organisations may choose additional prioritisation criteria, reflecting the specificities of their locations and activities.

Table 2: Materiality ratings of ecosystem services the construction materials sector typically depends on

Ecosystem services		Quarrying of stone, sand and clay	Support activities for other mining and quarrying	Installation of industrial machinery and equipment	Manufacture of non-metallic mineral products n.e.c.	Manufacture of other chemical products
Provisioning services	Water supply	High	Medium	Medium	Medium	Medium

L3: Interface with nature

Guiding questions:

Where are the sectors, value chains and direct operations with potentially moderate and high dependencies and impacts located?

Which biomes and specific ecosystems do our direct operations, and moderate and high dependency and impact value chain and sectors, interface with?

In this component, an organisation identifies the locations of activities and commodities in its direct operations and those in the value chain prioritised in L2. It then associates these and the locations of direct operations with biomes and ecosystems.

When identifying locations, organisations should iterate with the Evaluate phase to understand how dependencies and impacts on nature can arise beyond the site boundary, interfacing with other biomes and ecosystems. Organisations should also consider the guidance on locating activities provided under L1 and areas of influence in Box 2, where relevant.

Where individual downstream users cannot be identified, organisations may want to consider analysing the distribution of construction materials across sectors for each market where they operate. This will allow initial identification of potentially high dependency or impact downstream activities for further analysis.

Identification of biomes and ecosystems

Organisations may also refer to the [TNFD biome guidance](#) for further guidance when analysing their interfaces with these biomes, particularly the guidance on rivers and streams for organisations with sand dredging in their value chains. Organisations should consider the possible interfaces with subterranean ecosystems such as underground rivers and springs.¹⁰

L4: Interface with sensitive locations

Guiding questions:

For our organisation's activities in moderate and high dependency and impact value chains and sectors, which of these are in ecologically sensitive locations?

And which of our direct operations are in sensitive locations?

Table 5 sets out how some of the biomes and ecosystems that construction materials organisations typically interact with may meet the criteria for sensitive locations. Construction materials organisations should consider the wider context around the site when assessing sensitivity. An isolated, small forest on limestone surrounded by farmland may be more important for species than a quarry site in a small part of a larger forest of similar type.¹¹

¹⁰ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

¹¹ IUCN (2014) [Biodiversity management in the cement and aggregates sector: Integrated Biodiversity Management System \(IBMS\)](#).

Organisations should iterate between the Locate and Evaluate phases to understand the environmental assets beyond the site boundary that the organisation has dependencies and impacts on and may be in sensitive locations. Organisations should refer to the [TNFD guidance on the LEAP approach](#) for further detail on identifying sensitive locations.

Table 5: Considerations for the construction materials industry in identifying sensitive locations

Natural features	Considerations for identifying sensitive locations
Karst ecosystems	<p>Karst ecosystems are characterised by systems of underground streams and caves, enclosed depressions, dry valleys, gorges, prominent rock outcrops and large springs.</p> <p>Biodiversity importance: Karst ecosystems often harbour unique (often endemic) cave fauna and flora¹² and so are likely to be classified as of biodiversity importance. The importance for species can be exacerbated by restrictions to those species’ ranges as a result of agricultural expansion and intensification.</p> <p>Ecosystem integrity: Agricultural expansion and intensification around karst landscapes can contribute to a decline in ecological integrity in the karst landscape itself.</p>
Rivers and streams	<p>Ecosystem integrity: Sand dredging can contribute to a decline in ecosystem integrity in rivers all the way down to the river delta or estuary as a result of unsustainable sediment extraction. Organisations should consider whether rivers in their value chain are experiencing a rapid decline in integrity and are therefore classed as sensitive.</p>

List of sources of further information, datasets and tools

2.3. Evaluate dependencies and impacts on nature

This section provides additional guidance to help construction materials industry organisations with the Evaluate phase of the LEAP approach.

E1 E1: Identification of environmental assets, ecosystem services and impact drivers

Guiding questions:

What are the business processes and activities to be analysed?

What environmental assets, ecosystem services and impact drivers are associated with these business processes, activities and assessment locations?

Guidance for components E1 and E2 is provided together under E2.

E2 E2: Identification of dependencies and impacts

Guiding question:

What are our dependencies and impacts on nature?

This section focuses primarily on dependencies and impacts in construction materials organisations' direct operations. Organisations should refer to the relevant [TNFD sector guidance](#) for forestry, pulp and paper, metals and mining, and construction, engineering and real estate for dependencies and impacts upstream and downstream. Engagement with Indigenous Peoples, Local Communities and affected stakeholders can provide further insights, and organisations may find it useful to refer to the TNFD's [Guidance on engagement with Indigenous Peoples, Local Communities and affected stakeholders](#).

Impacts

Table 6, Table 7 and Table 8 provide examples of negative impact pathways for quarrying, sand extraction and cement manufacturing. These tables describe impacts on different environmental assets, but the organisation will need to consider how these apply to their specific locations and their areas of influence. Organisations should note that the example environmental assets and environmental services outlined in these tables are non-exhaustive and that others not listed may also be relevant.

Tables 3 and 4 in the guidance for the Locate phase in this document also provide a list of impact drivers typically associated with the construction materials industry. These tables present global sector averages. Actual dependencies will vary for individual production processes across the value chain, commodities and geographical contexts.

Table 6: Examples of negative impact pathways for quarrying

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Land, freshwater and ocean use change</p> <p>Land ecosystem use: Quarrying requires land clearance and consequent destruction of habitats to allow the development of production and extraction sites. Further indirect land-use change arises from the construction of access roads and other auxiliary infrastructure and the increased access to the area this creates for wider human activities.</p>	<p><i>Environmental assets</i></p> <p>Land</p> <p>Terrestrial and subterranean ecosystems</p> <p><i>Ecosystem services</i></p> <p>Local biomass provisioning</p> <p>Pollination</p> <p>Biological control</p> <p>Soil and sediment retention</p> <p>Flood mitigation</p> <p>Nursery population and habitat maintenance</p> <p>Local and global climate regulation</p> <p>Genetic materials</p> <p>Cultural services</p>	<p>Terrestrial and subterranean habitats will be altered by the extraction, management and rehabilitation or reclamation phases of quarrying. This can disrupt ecosystems and ecological functions due to reduced habitat extent, increased erosion and habitat degradation.</p> <p>Land-use change can also cause habitat fragmentation, which impedes species’ feeding and reproduction patterns, reducing populations and increasing extinction risk.</p> <p>These changes can have knock-on effects on ecosystem services, including cultural services. Land-use change can lead to the displacement of communities for new asset construction or transportation routes. It may also cause disruption and/or damage to local sacred areas. Consultation with stakeholders from affected communities will highlight these concerns and allow impacts on these resources to be assessed.</p>

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Non-GHG air pollutants: Quarrying activity can create dust pollution.</p>	<p><i>Environmental assets</i></p> <p>Atmospheric systems</p> <p>Terrestrial land-based ecosystems</p> <p>Freshwater ecosystems</p> <p>Marine ecosystems</p> <p><i>Ecosystem services</i></p> <p>Pollination</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Cultural services</p>	<p>Dust can lead to degradation of the quality of the surrounding atmospheric systems and ecosystems. This can affect local ecosystems by decreasing the quality of land, contaminating plants and affecting the health of animals. This in turn can disrupt ecosystem service provision such as pollination, biological control, nursery population and habitat maintenance and cultural services.</p> <p>Pollution may also lead to the worsening health and living conditions of surrounding local communities.</p> <p>Local air currents will influence which ecosystems might be affected.</p>
<p>Pollution/pollution removal</p> <p>Water pollutants: Discharged water from quarrying processes may have:</p> <ul style="list-style-type: none"> • Higher temperature; • Increased acidity; • Elevated concentrations of heavy metals such as arsenic, cobalt, copper, cadmium, lead, silver and zinc from excavated rock; • Suspended solids as a result of erosion of exposed earth; and • Other pollutants. 	<p><i>Environmental assets</i></p> <p>Subterranean freshwater ecosystems</p> <p>Freshwater ecosystems</p> <p>Water resources</p> <p><i>Ecosystem services</i></p> <p>Water flow regulation</p> <p>Water supply</p> <p>Water purification</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Cultural services</p>	<p>Changes in water temperature can affect the health of aquatic organisms living in the habitat, support the spread of disease and create the conditions for invasive species.</p> <p>Increased acidity can be harmful to aquatic organisms.</p> <p>Heavy metals can also cause serious health problems for aquatic organisms and the people that consume them or the water.</p> <p>Excessive sediment can clog riverbeds and smother watershed vegetation, wildlife habitat and aquatic organisms.</p>

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Disturbances: Noise and light pollution.</p> <p>Species can be affected by noise and light pollution during routine operation (e.g. extraction processes, movement of vehicles) and if the facilities are lit.</p>	<p><i>Environmental assets</i></p> <p>Terrestrial land-based ecosystems</p> <p><i>Ecosystem services</i></p> <p>Pollination</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Cultural services</p>	<p>Wildlife may be disturbed by increased human access and noise from blasting and quarry traffic.</p>
<p>Resource use/replenishment</p> <p>Water use: Water is used across the lifecycle of the quarry including for aggregate and sand washing, to wash the extracted materials, for vehicle cleaning and dust cloud suppression. It is usually extracted either from a local freshwater body or obtained from the quarry dewatering process required to create dry extraction areas.</p>	<p><i>Environmental assets</i></p> <p>Subterranean freshwater ecosystems</p> <p>Freshwater ecosystems</p> <p>Water resources</p> <p><i>Ecosystem services</i></p> <p>Water flow regulation</p> <p>Water supply</p> <p>Water purification</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Cultural services</p>	<p>Water extraction can lead to the dewatering of aquifers, subterranean freshwater ecosystems and the depletion of other water resources, especially in arid and drought-prone areas. Quarry dewatering may affect the groundwater level.</p> <p>These activities can lead to reduced water flow regulation and increased drought severity and frequency. Such water use affects the supply of water to other users – households, fishing, aquaculture and agriculture – and to nature, with many ecosystem services affected, including water purification, water flow regulation, water supply and recreation-related services.</p>

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Invasive species introduction/removal</p> <p>Introduction of invasive species: Quarries and quarrying can contribute to the establishment of invasive alien plant species through:</p> <ul style="list-style-type: none"> • Changes in the environmental conditions on-site as a result of the quarry itself favouring certain species over others or altering water flows leading to the spread of plant material to new locations; • Vehicle movements and movement of materials containing plant material to new locations; and • Inappropriate planting of non-native species. 	<p><i>Environmental assets</i></p> <p>Terrestrial land-based ecosystems</p> <p>Freshwater ecosystems</p> <p><i>Ecosystem services</i></p> <p>Pollination</p> <p>Biological control</p> <p>Genetic material</p> <p>Nursery population and habitat maintenance,</p> <p>Cultural services</p>	<p>Change in the structure and function of ecological communities due to the arrival of new species.</p>

Table 7: Example negative impact pathways for sand extraction from river and marine environments

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Land, freshwater and ocean use change</p> <p>Freshwater use change: Sand is a key input for cement and concrete production. An estimated 32 to 50 billion tonnes of aggregates (mostly sand, gravel and stones) are extracted every year. It is often extracted from rivers, but marine sand is also used.</p>	<p><i>Environmental assets</i></p> <p>Freshwater ecosystems</p> <p>Underwater mineral resources</p> <p><i>Ecosystem services</i></p> <p>Water flow regulation</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Soil and sediment retention</p> <p>Flood mitigation</p> <p>Cultural services</p>	<p>Dredging rivers lowers the riverbed and surrounding water table. Mining sand in river floodplains can also alter the river’s course.</p> <p>When not well managed, this sand extraction:</p> <ul style="list-style-type: none"> • Destroys habitats, including the delta downstream as sediment flows are disrupted; • Affects aquatic species, with changes to the aquatic species’ ability to migrate through rivers that can prevent their reproduction and affect feeding patterns; • Increases the incidence and severity of droughts as streams and tributaries of major rivers dry up as a result of the sediment removal; • Lowers water quality through increased sediment suspension; • Increases erosion; and • Affects downstream communities through reduced access to water, increased water purification costs and reduced fish populations. <p>Overly mined ecosystems can be very slow or even unable to recover, diminishing the availability of mineral resources over the long term.</p>

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Land, freshwater and ocean use change</p> <p>Ocean-use change: 6 billion tonnes of construction sand are extracted each year from marine and coastal environments.</p>	<p><i>Environmental assets</i></p> <p>Marine ecosystems</p> <p>Underwater mineral resources</p> <p><i>Ecosystem services</i></p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Flood mitigation</p> <p>Cultural services</p>	<p>Marine and coastal sand dredging can:</p> <ul style="list-style-type: none"> • Increase seawater turbidity; • Alter aquatic nutrient availability; • Contribute to the salinisation of freshwater aquifers; and • Contribute to coastal erosion, affecting coastal communities coastal defences and offshore energy infrastructure.
<p>Pollution/pollution removal</p> <p>Solid waste: Some sand miners dispose of sand mining waste on open land areas and riverbeds.</p>	<p><i>Environmental assets</i></p> <p>Terrestrial, freshwater and marine ecosystems</p> <p><i>Ecosystem services</i></p> <p>Water flow regulation</p> <p>Nursery population and habitat maintenance</p> <p>Soil quality regulation</p> <p>Water purification</p> <p>Cultural services</p>	<p>Solid waste contributes to the degradation of the environmental assets where it is disposed of and disrupts the ecosystem services those assets provide.</p>

Drivers of nature loss	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Disturbances: Noise pollution.</p>	<p><i>Environmental assets</i></p> <p>Terrestrial land-based ecosystems</p> <p>Freshwater ecosystems</p> <p>Marine ecosystems</p>	<p>The extraction of sand from rivers and the marine environment can contribute to noise pollution in these ecosystems, affecting species' behaviour.</p>

Table 8: Example negative impact pathways for cement manufacturing

Impact drivers	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Non-GHG air pollutants: Pollutants released during the manufacture of clinker for cement, include:</p> <ul style="list-style-type: none"> • Sulphur dioxide (SO₂) and nitrogen oxide (NO_x) created by the kiln and drying operations; • Volatile organic compounds (VOCs) from stored gasoline, solvents and other industrial chemicals, and incomplete combustion; and • Dust from the raw mills, the kiln system, the clinker cooler and the cement mills. 	<p><i>Environmental assets</i></p> <p>Atmospheric systems</p> <p>Terrestrial and subterranean land-based ecosystems</p> <p>Freshwater and subterranean freshwater ecosystems</p> <p>Marine ecosystems</p> <p><i>Ecosystem services</i></p> <p>Local (micro and meso) climate regulation</p> <p>Rainfall pattern regulation</p> <p>Biological control</p> <p>Pollination</p>	<p>Non-GHG air pollutants can lead to the degradation of the quality of the surrounding atmospheric systems and ecosystems. Sulphur dioxide (SO₂) and nitrogen oxide (NO_x) are primary contributors to acid deposition or acid rain.</p> <p>Dust formation can disrupt local ecosystems by decreasing the quality of land, disrupting pollination, contaminating plants and affecting the health of animals.</p> <p>Pollution may also lead to the worsening health and living conditions of surrounding local communities.</p> <p>Organisations should consider local air currents to determine which ecosystems might be affected.</p>

Impact drivers	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Water pollutants: Discharged water from manufacturing processes may have:</p> <ul style="list-style-type: none"> • Temperature changes; • Acidity changes; • Increased suspended solids content; • Metal pollutants (Co, Cd, Cr, Cu, Ni, Pb and Zn); • Increased chemical oxygen demand (COD), which can be above standard for effluent discharge into surface water near cement plants; and • Elevated phosphates and nitrates due to detergents used for washing. 	<p><i>Environmental assets</i></p> <p>Freshwater and subterranean freshwater ecosystem</p> <p>Water resources</p> <p>Terrestrial and subterranean terrestrial ecosystems</p> <p><i>Ecosystem services</i></p> <p>Water flow regulation</p> <p>Water supply</p> <p>Water purification</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Soil and sediment retention</p> <p>Flood mitigation</p> <p>Cultural services</p>	<p>Changes in water temperature can affect the health of aquatic organisms living in the habitat, support the spread of disease and create the conditions for invasive species.</p> <p>Increased acidity can be harmful to aquatic organisms.</p> <p>Excessive sediment can clog riverbeds and smother watershed vegetation, wildlife habitat and aquatic organisms.</p> <p>Heavy metals can also cause serious health problems for aquatic organisms and the people that consume them.</p>

Impact drivers	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Soil pollutants: Manufacturing activities can result in the pollution of soil, through deposits of cement kiln dust, dioxins and heavy metals.</p>	<p><i>Environmental assets</i></p> <p>Terrestrial land-based ecosystems</p> <p>Freshwater ecosystems</p> <p>Marine ecosystems</p> <p><i>Ecosystem services</i></p> <p>Water flow regulation</p> <p>Biological control</p> <p>Nursery population and habitat maintenance,</p> <p>Soil and sediment retention</p> <p>Flood mitigation</p> <p>Cultural services</p>	<p>Soil pollutants can cause changes to soil structure and organic content and affect wildlife.</p> <p>Cement kiln dust can be created when exhaust gas passes through the pulverised material, resulting in a dispersion of gas and particles, including particulate matter (PM) pollutants. This can have a negative impact on human and animal health, depending on particle size, concentration, exposure time and the presence of toxic substances such as acids, metals, organic particles and other hazardous air pollutants (HAPs).</p> <p>Dioxins are a group of chemically related compounds that are persistent environmental pollutants (POPs). Dioxins can cause reproductive and developmental problems and suppress immune function in animals and humans. Their half-life in the human body is estimated to be 7 to 11 years and long-term exposure is linked to impairment of the immune system, the developing nervous system, the endocrine system and reproductive functions.</p> <p>Heavy metals remain in the soil for a long period and alter the soil pH, colour, porosity and natural chemistry, damaging the health of plants and the people and animals that feed on them.</p> <p>Soil pollutants may runoff in stormwater and affect freshwater and marine ecosystems and the supply of clean water to downstream communities.</p>

Impact drivers	Example environmental assets and ecosystem services affected	Description of impact
<p>Resource use/replenishment</p> <p>Water use: Concrete production is responsible for 9% of global industrial water withdrawal or 1.7% of total global water withdrawal. By 2050, 75% of the water demand for concrete production is expected to occur in regions likely to experience water stress. Other than at the quarrying stages, most water withdrawal occurs during the midstream production of products like clinker, cement and concrete. In particular, water is used for cooling equipment and exhaust gases, for wet-process kilns (almost entirely replaced by more efficient dry-process technologies), for aggregate washing and for the manufacturing of concrete.</p>	<p><i>Environmental assets</i></p> <ul style="list-style-type: none"> Subterranean freshwater ecosystems Freshwater ecosystems Water resources <p><i>Ecosystem services</i></p> <ul style="list-style-type: none"> Water flow regulation Water supply Biological control Nursery population and habitat maintenance Cultural services 	<p>Water use can lead to the dewatering of aquifers, subterranean freshwater ecosystems and the depletion of other water resources, especially in arid and drought-prone areas. Additionally, quarry dewatering may have an impact on the groundwater level, affecting freshwater ecosystems.</p> <p>This can lead to reduced water flow and increased drought severity and frequency. Such water-use affects the supply of water to other users – households, aquaculture and agriculture – and to nature, with many ecosystem services affected, such as water flow regulation, water supply and recreation-related services.</p>

Impact drivers	Example environmental assets and ecosystem services affected	Description of impact
<p>Resource use/replenishment</p> <p>Use of non-renewable natural resources: Non-renewable resources to produce cement and concrete include: limestone, shale, clay, hard crushed rock, sand and gravel. Global aggregate production is currently estimated at 40 to 45 billion tonnes, with more than 50 billion tonnes of sand extracted globally every year.</p>	<p><i>Environmental assets</i></p> <ul style="list-style-type: none"> Terrestrial land-based ecosystems Mineral and energy resources Underground mineral and energy resources Freshwater ecosystems <p><i>Ecosystem services</i></p> <ul style="list-style-type: none"> Water flow regulation Biological control Nursery population and habitat maintenance Soil and sediment retention Flood mitigation Cultural services 	<p>Ecosystem services affected by extraction of non-renewable natural resources include soil and sediment retention, flood mitigation, water flow regulation and nursery population and habitat maintenance.</p>

Impact drivers	Example environmental assets and ecosystem services affected	Description of impact
<p>Pollution/pollution removal</p> <p>Disturbance: Noise and light pollution. Noise emissions occur throughout the whole cement manufacturing process, particularly from heavy machinery chutes and hoppers; any operations involving the crushing and milling of raw materials, as well as fuels, clinker production; exhaust fans; blowers and duct vibrations.</p>	<p><i>Environmental assets</i></p> <p>Terrestrial land-based ecosystems</p> <p><i>Ecosystem services</i></p> <p>Pollination</p> <p>Biological control</p> <p>Nursery population and habitat maintenance</p> <p>Cultural services</p>	<p>Species can be disturbed by noise and light pollution, with impacts on ecosystem services.</p>

Dependencies

Table 9: Examples of dependency pathways for the construction materials sector

Business activity	Environmental assets and ecosystem services depended on	Description of dependencies
Quarrying; sand mining	<p><i>Environmental assets</i></p> <ul style="list-style-type: none"> Underwater mineral and energy resources Marine ecosystems Land Terrestrial and subterranean terrestrial ecosystems Mineral and energy resources Water resources Freshwater ecosystems <p><i>Ecosystem services</i></p> <ul style="list-style-type: none"> Water supply Biological control Soil and sediment retention Flood mitigation Water flow regulation Rainfall pattern regulation Local and global climate regulation Solid waste remediation Storm mitigation Water purification Air filtration Noise attenuation 	<p>The construction materials sector is centred on the extraction of mineral resources from the environment, so has a high dependency on the natural processes that create these resources.</p> <p>An organisation should particularly pay attention to its dependency on sand production, which is being extracted at unsustainable rates in many locations, notably China and India.</p> <p>Extraction operations are further supported by provisioning services such as the supply of clean water.</p> <p>Ecosystems surrounding sites also protect operations from natural hazards such as floods and storms, and help to stabilise the surrounding soil, supporting operations and reducing the risk of landslides.</p> <p>Quarrying is also associated with the production of various pollutants and disturbances, as discussed in Table 6. Construction materials organisations in turn depend on ecosystems to dilute these byproducts to protect the local environment, communities and workers.</p>

Business activity	Environmental assets and ecosystem services depended on	Description of dependencies
Cement manufacturing: water use	<p><i>Environmental assets</i></p> <p>Underwater mineral and energy resources</p> <p>Water resources</p> <p>Freshwater and subterranean freshwater ecosystems</p> <p><i>Ecosystem services</i></p> <p>Water supply</p> <p>Water flow regulation</p> <p>Water purification</p> <p>Rainfall pattern regulation</p>	<p>Cement production requires a supply of clean water as the binding ingredient for the hydration process. If ecosystems are degraded, or water across the catchment area is extracted at an unsustainable rate, the supply of this clean water may be disrupted.</p> <p>Where water is sourced from third party providers, that organisation's dependencies on water resources and water-related ecosystem services should also be analysed.</p>

Sources: ENCORE Partners (2024) [ENCORE: Exploring Natural Capital Opportunities, Risks and Exposure](#); Katz-Lavigne, S. et al. (2021) [Mapping Global Sand: Extraction, research and policy options](#); University of Illinois Urbana-Champaign (1995) [Scientific principles](#).

Table 2 in the guidance for the Locate phase in this document also provides a list of ecosystem services typically depended on by the construction materials industry. These tables present global sector averages. Actual dependencies will vary for individual production processes across the value chain, commodities and geographical contexts.

External factors

Organisations should take into account external factors that may affect the availability of environmental assets and ecosystem services on their sites. Climate change is likely to be of particular relevance, contributing to a higher frequency of extreme weather events, such as droughts and floods, and affecting the wider ecosystem condition, for example, through longer-term changes to rainfall patterns and lowering of water tables. These factors influence the provisioning and regulating ecosystem services that the construction materials sector depends on, such as soil and sediment retention and water supply.

Organisations should refer to the TNFD's [biome guidance](#) for more examples of ecosystem services that may be present in the locations where the organisation is operating.

E3 E3: Dependency and impact measurement

Guiding questions:

What is the scale and scope of our dependencies on nature?

What is the severity of our negative impacts on nature? What is the scale and scope of our positive impacts on nature?

Organisations should refer to the metrics in Section 3 for guidance on what indicators and metrics to use in measuring dependencies and impacts.

E4 E4: Impact materiality assessment

Guiding question:

Which of the identified impacts are material?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

2.4. Assess nature-related risks and opportunities

This section provides additional guidance to help construction materials industry organisations with the Assess phase of the LEAP approach.

A1: Risk and opportunity identification

Guiding question:

What are the corresponding risks and opportunities for our organisation?

Risks

Table 10 provides a list of illustrative nature-related physical and transition risks for the construction materials industry. Organisations should note that the example risks and opportunities outlined in these tables are non-exhaustive and that there may also be other relevant risks and opportunities to consider.

Table 10: Illustrative nature-related risks in the construction materials sector

Risk type		Illustrative risk in the construction materials sector	Magnitude indicators
Physical, transition or systemic-type risk	Risk category		
Physical	Acute	<p>Increased risk of damage from floods, storms and landslides if protective terrestrial ecosystems are degraded</p> <p>Increased habitat rehabilitation or reclamation costs if soil quality is degraded</p> <p>Increased water purification costs as a result of accidental oil spillages upstream</p> <p>Repair costs and interruptions to business activity following damage to infrastructure due to wildfires, tropical cyclones, extreme heat and other extreme weather events</p>	<p>Increase in operational costs due to interruption of, or reduction in, productivity of operations/supply chain</p> <p>Increase in closure and rehabilitation or reclamation costs due to degradation in soil quality and insufficient material balance</p> <p>Cost of write-offs and early retirement of existing business assets</p> <p>Increased insurance costs</p>

Risk type		Illustrative risk in the construction materials sector	Magnitude indicators
Physical, transition or systemic-type risk	Risk category		
Physical	Chronic	<p>Declining water supply and/or water quality as a result of the organisation’s activities, those of others in the watershed and climate change</p> <p>Declining sand supply as a result of unsustainable dredging in river areas/ marine areas</p> <p>Disruption of operations due to scarcity and increased cost of raw materials and freshwater</p>	<p>Cost of disruption to operations and increase in the cost of water management and control</p> <p>Increase in insurance costs resulting from natural disasters</p> <p>Decline in value of business assets due to lack of availability of natural resources</p>
Transition	Reputational	<p>Changes in sentiment towards the organisation/brand due to competition for natural resources (e.g. water, land), impacts on nature and/or failure to meet expected stakeholder community expectations (e.g. nature no net loss, failure to meet rehabilitation or reclamation and closure expectations, or late life divestments)</p> <p>Disruption to operations due to, for example, the discovery of rare species on-site</p>	<p>Downward revisions to business growth forecasts due to inability to gain new land access</p> <p>Cost of operational interruptions due to community conflict or unexpected nature protection activity</p> <p>Reduction in revenue due to reduced brand value</p> <p>Staff turnover and application numbers for vacant posts</p>

Risk type		Illustrative risk in the construction materials sector	Magnitude indicators
Physical, transition or systemic-type risk	Risk category		
Transition	Policy	<p>Reduced areas available to explore for quarrying as more areas are placed under protection mechanisms (e.g. as identified in National Biodiversity Strategies and Action Plans (NBSAPs))</p> <p>Increased restrictions on access to remote areas where remaining reserves are located</p> <p>Tighter regulations requiring longer suspensions of operations to facilitate inspections and surveys when, for example, previously undetected important cave systems are discovered</p>	<p>Increase in cost of damage payouts (e.g. fines, penalties, compensation, license revocation) caused by environmental incidents or non-compliance</p> <p>Cost of additional habitat regeneration following introduction of biodiversity offset schedule to support government no net loss or nature-positive initiatives</p> <p>Increase in costs and reduction in revenue due to interruption of operations/supply chain as sites for suppliers are limited</p> <p>Costs related to the loss of operating areas</p> <p>Increase in timeframes for new projects, permits and land access</p> <p>Operating area lost due to collective land rights claims by Indigenous Peoples and Local Communities</p>

Opportunities

Nature-related opportunities are activities that create positive outcomes for organisations and nature through positive impacts or mitigation of negative impacts on nature. Illustrative examples of nature-related opportunities are outlined in Table 11 below.

Table 11: Illustrative nature-related opportunities for the construction materials sector

Opportunity type	Illustrative opportunity in the construction materials sector	Magnitude indicators
Markets	Opportunities for organisations to engage in emerging natural capital markets	Increase in revenues
Resource efficiency	Reduce water consumption by replacing wet process technology kilns with dry process kilns ¹³	Reduction in water costs
Products and services	New products that are designed for disassembly to allow for reuse of materials after building deconstruction ¹⁴	Revenue from new products as market shifts towards more circularity for materials
	Replace virgin raw materials through the reuse and repurposing of waste and loss into alternative products (e.g. recycled concrete aggregates, recycled powder and recycled construction demolition waste) ¹⁵	Cost reductions
	Certification of sustainable products	Revenue from such products
	Use of owned or managed natural assets to create or enhance ecosystem services that may be monetised (e.g. natural flood risk management)	Increase in revenue from payments for ecosystem services
Reputational capital	Increase in consumer brand loyalty and enhanced social licence to operate through actions such as transparent biodiversity management plans and focus on circular economy	Increase in revenue

Opportunity type	Illustrative opportunity in the construction materials sector	Magnitude indicators
Ecosystem protection, restoration and regeneration	<p>Conservation (e.g. through the creation of temporary habitats during the quarry lifecycle)</p> <p>Investment in natural flood management activities upstream of quarries/extraction areas/roads to prevent flooding of the organisation’s assets</p> <p>Investment in nature restoration in areas surrounding sites to improve connectivity</p> <p>Implement fragmentation mitigation measures (e.g. wildlife overpasses, underpasses, wildlife-friendly culverts and canopy bridges) on-site</p> <p>Integrated multi-stakeholder action at land/seascape/river basin/jurisdictional/sector scale</p> <p>Manage and rehabilitate or reclaim a site in such a way that species present in the past may be encouraged to recolonise</p>	<p>Increase in species populations</p> <p>Increase in ecosystem extent and condition</p> <p>Increase in public access to green space</p>

A2

A2: Adjustment of existing risk mitigation and risk and opportunity management

Guiding questions:

What existing risk and opportunity management processes and elements are we already applying?

How can risk and opportunity management processes and associated elements (e.g. risk taxonomy, risk inventory and risk tolerance criteria) be adapted?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

A3: Risk and opportunity measurement and prioritisation

Guiding question:

Which risks and opportunities should be prioritised?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

A4: Risk and opportunity materiality assessment

Guiding question:

Which risks and opportunities are material and therefore should be disclosed in line with the TNFD recommended disclosures?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

2.5. Prepare to respond and report

This section provides additional guidance to help construction material industry organisations with the Prepare phase of the LEAP approach.

The Kunming-Montreal Global Biodiversity Framework (GBF) aims to “halt and reverse biodiversity loss” by 2030, envisioning “a world living in harmony with nature” by 2050. Achieving this implies a transition which will require significant business changes across sectors. The TNFD has published draft guidance to help organisations develop and disclose nature transition plans. These plans provide a structured way to manage responses and contributions to this transition, starting with key priorities and expanding over time as understanding improves, such as through a LEAP assessment. The LEAP Prepare phase provides initial guidance for addressing dependencies, impacts, risks, and opportunities, laying the groundwork for a nature transition plan.

P1 P1: Strategy and resource allocation plans

Guiding question:

What risk management, strategy and resource allocation decisions should be made as a result of this analysis?

Table 12 presents illustrative priority and transformative actions that construction materials sector organisations may want to consider based on the dependencies, impacts, risks and opportunities identified in the Evaluate and Assess phases. All actions have been categorised by the corresponding impact driver and classified according to the TNFD’s interpretation of [SBTN’s AR3T framework](#) (Figure 5): avoid and reduce negative impacts; restore and regenerate; transformation of business models, products, services, markets and investments; and contributing to needed systemic change inside and outside value chains.

Figure 5: SBTN's AR3T framework

In preparing to respond, organisations should:

- Consider the potential actions across all their sites – including inactive quarries and office sites – and across the quarry lifecycle, including scope to create temporary habitats;
- Consider where there is a need to accelerate innovation to meet nature goals, including a rethinking of business models, circular economy opportunities, and making more use of nature-based solutions to manage on-site risks such as flooding and water quality issues; and
- Apply the mitigation hierarchy (Box 3), working towards no net loss, and in the best case, a net gain for nature.

Organisations should also refer to best practices for biodiversity management plans, quarry rehabilitation or reclamation plans and procurement, including:

- Quarry biodiversity management:
 - [GCCA Sustainability Guidelines for quarry rehabilitation and biodiversity management](#);
 - BirdLife Europe and Central Asia's [Extractive Sector Species Protection Code of Conduct](#);
- Water management:
 - [GCCA Sustainability Guidelines for the monitoring and reporting of water in cement manufacturing](#);

- Circular economy:
 - [GCCA Policy Document on Circular Economy](#);
 - [GCCA Sustainability Guidelines for co-processing fuels and raw materials in cement manufacturing](#);
- Cross-cutting:
 - WEF's [Nature Positive: Role of the Cement and Concrete Sector](#); and
 - Certification standards from the [Concrete Sustainability Council](#).

Box 3: The mitigation hierarchy

The mitigation hierarchy requires that an organisation follows a series of essential and sequential steps over the project's lifecycle. Organisations should maximise the actions in the first step before proceeding to action under the second, and so forth. The actions are:

1. Avoid creating harmful impacts, for example, through careful spatial placement of infrastructure, or timing of construction;
2. Minimise the harmful impacts that are unavoidable, by reducing their duration, intensity or extent;
3. Rehabilitate, reclaim or restore the site after exposure to harmful impacts, trying to return the area to a state as close as possible to how it was before the impacts took place; and
4. Offset: The organisation may wish to compensate further for any residual adverse impacts after the full implementation of the previous three steps of the mitigation hierarchy. Nature offsetting is an emerging topic and organisations should refer to best practices, such as those being prepared by the [International Advisory Panel on Biodiversity Credits](#).

Quarry rehabilitation or reclamation can contribute significantly to mitigating residual impacts and in many cases will be able to deliver no net loss, in which case it can be sufficient alone, without the need for compensation projects or offsets. Organisations should refer to the [GCCA Sustainability guidelines for quarry rehabilitation and biodiversity management](#) for guidance on applying the mitigation hierarchy in the construction materials sector.

Source: The Biodiversity Consultancy (no date) [Net positive and the mitigation hierarchy](#); GCCA (2020) [Sustainability Guidelines for quarry rehabilitation and biodiversity management](#).

Table 12: Illustrative priority and transformative actions for the construction materials sector mapped to the AR3T Framework

Impact driver/ dependency	Example of responses to impacts/ dependencies on nature and associated risks	International frameworks alignment	SBTN action framework (AR3T)				
			Avoid	Reduce	Regenerate	Restore	Transform
Land-use change	Avoid ecologically sensitive areas, particularly protected areas, as well as areas likely to become protected under countries' updated National Biodiversity Strategies and Action Plans (NBSAPs). Instead, focus development in already modified habitats such as brownfield or intensively farmed areas.	Council Directive 92/43/EEC (Habitats Directive) Article 6(4) GBF Target 3 SBTN Interim Targets SDG 15					
	Adopt a biodiversity management plan; restore and regenerate nature by introducing innovative and nature-based solutions such as temporary habitats; and where possible, commit to improving biodiversity through habitat restoration and reinstatement (adopt quarry rehabilitation or reclamation plans) after clearance/decommissioning.	GBF – Targets 2, 3, 11, 12 SDG 15					
	Regularly review environmental impact assessments on existing sites using, for example, rapid biodiversity surveys.	SDG 15					

Impact driver/ dependency	Example of responses to impacts/ dependencies on nature and associated risks	International frameworks alignment	SBTN action framework (AR3T)				
			Avoid	Reduce	Regenerate	Restore	Transform
Land-use change	Support developments of nature-based solutions for water quality and flood risk management in river catchments containing the organisation’s operations. Support other nature restoration projects in organisation’s areas of influence.						
	Implement fragmentation mitigation measures (e.g. wildlife overpasses, underpasses, wildlife-friendly culverts and canopy bridges) to support connectivity.						
	Promote pollinators on-site by creating nectar and pollen-rich habitats, species-rich grassland, nesting and overwintering habitats, and ponds with shallow edges during temporary and permanent rehabilitation or reclamation activities; construction of green roofs and walls; and avoiding the use of insecticides.	SDG 15					

Impact driver/ dependency	Example of responses to impacts/ dependencies on nature and associated risks	International frameworks alignment	SBTN action framework (AR3T)				
			Avoid	Reduce	Regenerate	Restore	Transform
Resource use: water use	Implement a sustainable water management plan, prioritising regions of water stress. Actions may include continuous, systematic or periodic water monitoring; water risk assessments; and minimisation of freshwater withdrawals in water-stressed areas or during drought periods.	European Parliament and Council Directive 2000/60/EC (Water Framework Directive) GBF Target 11 GRI 303 SDG 6 UNEP Integrated Water Resources Management					

Impact driver/ dependency	Example of responses to impacts/ dependencies on nature and associated risks	International frameworks alignment	SBTN action framework (AR3T)				
			Avoid	Reduce	Regenerate	Restore	Transform
Resource use: water use	<p>Maximise recovery of process water (e.g. water reuse/recycling, closed loops), collecting, quantifying and mapping on-the-ground water use and mitigation policies already in place.</p> <p>Create artificial wetlands to reduce water withdrawal and improve water quality.</p> <p>Harvest rainwater.</p> <p>Partner with other local actors to share water resources (e.g. using discharges from other businesses operating in the vicinity of cement and concrete plants, as well as wastewater from local communities).</p>	SDG 6					
	Adopt less water-intensive processes and improve the water efficiency of production processes.	SDG 6					
	Implement water replenishment programmes and conservation/restoration of water species affected by water withdrawals.	<p>Net Positive Water Impact (UN Global Compact Water Resilience Coalition)</p> <p>SDG 6</p>					

Impact driver/ dependency	Example of responses to impacts/ dependencies on nature and associated risks	International frameworks alignment	SBTN action framework (AR3T)				
			Avoid	Reduce	Regenerate	Restore	Transform
Resource use: other	Avoid dredging sand from rapidly degrading or already degraded rivers/areas/marine areas.						
	Prioritise co-processing where possible. For example, in cement kilns, use alternative fuels, alternative raw materials such as industrial ashes and by-products, as well as supplementary cementitious materials in production processes. Innovate in recycling the sector's own waste streams.	SDG 12					
	Adopt circular practices that are restorative and regenerative by design. Employ material-efficient design for construction materials to support longevity, reuse and disassembly, and use low impact materials including reused or recycled materials or bio-based and low-carbon alternatives.	SDG 12					
	Improve the thermal efficiency in manufacturing processes through the modernisation of kilns and pioneering new concepts such as hydrogen, as well as by integrating new technologies such as Waste Heat Recovery (WHR) facilities in cement plants.						
	Improve traceability across the value chain.						

Impact driver/ dependency	Example of responses to impacts/ dependencies on nature and associated risks	International frameworks alignment	SBTN action framework (AR3T)				
			Avoid	Reduce	Regenerate	Restore	Transform
Measures against unintentional introduction of invasive alien species (IAS)	Always favour the use of native species in quarry rehabilitation or reclamation. Never use invasive alien species (e.g. as listed under national/local blacklists) in quarry rehabilitation or reclamation.	CEMBUREAU					
	Develop management measures for concerned species.	CEMBUREAU					
	If possible, implement wheel cleaning mechanisms for vehicles at the entrance to, and exit from, the quarry.	CEMBUREAU

P2: Target setting and performance management

Guiding question:

How will we set targets and define and measure progress?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

P3: Reporting

Guiding question:

What will we disclose in line with the TNFD recommended disclosures?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

Additionally, when considering international interoperability throughout their disclosure process, organisations may find it helpful to refer to the following documents:

- TNFD – European Financial Reporting Advisory Group (EFRAG) [Correspondence Mapping](#); and
- TNFD – Global Reporting Initiative (GRI) Standards [Interoperability Mapping](#).

P4: Presentation

Guiding question:

Where and how do we present our nature-related disclosures?

As for all components, refer to the [Guidance on the identification and assessment of nature-related issues: The LEAP approach](#).

3. Sector-specific disclosure metrics and related guidance – Construction materials

Sector-specific metrics form an important part of the TNFD’s measurement architecture (see Figure 6). This reflects the diversity of business models across value chains and their interface with nature across and within sectors. Sector-specific metrics help financial institutions to compare organisations within the same sector, which often face similar nature-related issues.

This section provides the TNFD sector-specific metrics for the construction materials sector. It includes:

- Guidance on the application of the core global disclosure indicators and metrics to the construction materials sector (Section 3.1); and
- Core and additional disclosure indicators and metrics for the construction materials sector (Sections 3.2 and 3.3).

Figure 6: TNFD disclosure measurement architecture

Where available, the TNFD's recommended metrics for disclosure draw from a range of existing standards and frameworks including the IFRS Sustainability Disclosure Standards, Sustainability Accounting Standards Board (SASB) Standards (now the responsibility of the International Sustainability Standards Board (ISSB)), GRI Standards, the CDP disclosure platform, the Kunming-Montreal Global Biodiversity Framework and other relevant UN frameworks, ESRS and others. A number of organisations, including standard-setting organisations, continue to work on identifying relevant sector-level assessment and reporting metrics. The Taskforce recommends that report preparers stay engaged with year-on-year progress on these developments and implement the latest definitions within their risk management processes and disclosures. The TNFD is working closely with standard-setting organisations and others and will periodically update this guidance on recommended sector metrics for disclosure in line with these ongoing initiatives.

Organisations in the construction materials sector should refer to Annex 1 of the [TNFD recommendations](#) for further information on the core global disclosure metrics. As outlined in the TNFD recommendations, core global disclosure metrics should be reported on a comply or explain basis, with the exception of the placeholder metrics.

Where organisations are unable to report against any of the core global metrics, they should provide a short explanatory statement as to why they have not reported those metrics. An organisation should report on the core global disclosure metrics unless:

- It has not been identified as relevant and material to the organisation, e.g. not relevant to business activities or the location the organisation is operating in, or not found to be a material issue for the organisation; or
- It has been identified as relevant and material, but the organisation is unable to measure it due to limitations with methodologies, access to data or because the information is commercially sensitive. In this case, organisations should explain how they plan to address this in future reporting periods.

Companies should report on the same basis for the core sector disclosure metrics outlined in Section 3.2.

Organisations are also encouraged to draw on the TNFD additional sector disclosure indicators and metrics outlined in Section 3.3 and any other relevant metrics to represent most accurately the organisation's nature-related dependencies, impacts, risks and opportunities.

3.1. Guidance on the application of the core global disclosure metrics

This section provides guidance, where relevant, on how to apply the TNFD core global disclosure metrics in the construction materials sector. If no further sector specific guidance is provided, organisations should refer to the core global disclosure metrics.

As outlined above, core global disclosure metrics should be reported on a comply or explain basis following the guidance for the construction materials sector where provided.

For the placeholder indicators on invasive alien species and the state of nature, the TNFD encourages organisations to consider and report against these indicators where possible, but these are not expected on a comply or explain basis. There are not yet widely accepted metrics for these indicators, but the Taskforce recognises their importance, and will continue to work with knowledge partners to develop further guidance on these metrics.

Companies applying the SBTN methods to set SBTs for Nature will be required to use mostly the same indicators as recommended by TNFD. In some instances, additional data may be required or recommended by SBTN to set and implement targets.

Table 13: Guidance on the application of the core global disclosure metrics

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
	GHG emissions	Refer to IFRS S2 Climate-related Disclosures.	No further sector specific guidance. Refer to the core global metric guidance.	
C1.0	Total spatial footprint	Total spatial footprint (km ²) (sum of): <ul style="list-style-type: none"> • Total surface area controlled/ managed by the organisation, where the organisation has control (km²); • Total disturbed area (km²); and • Total rehabilitated/restored area (km²). 	In reporting the land spatial footprint for quarrying activities under this core global disclosure metric, an organisation should include land owned, leased or managed in the exploration, development and production, closure and post-closure project phases. Organisations should refer to other relevant TNFD sector guidance for reporting downstream spatial footprints, in particular the engineering, construction and real estate guidance.	SASB EM-CM-160a.2. TNFD

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C1.1	Extent of land/ freshwater/ ocean-use change	Extent of land/freshwater/ocean-use change (km ²) by: <ul style="list-style-type: none"> • Type of ecosystem;¹⁶ and • Type of business activity. 	<p>In reporting ecosystem use change associated with quarrying, the extent of land/freshwater/ocean ecosystem use change (km²) should cover the gross area disturbed, as well as the gross area reclaimed in the reporting period. Values should be broken down by area disturbed in each phase as follows:</p> <ul style="list-style-type: none"> • Pre-disturbance; • Clearance; • Extraction, development and production; • Quarry closure; and • Post-closure project phases, including rehabilitation or reclamation, while the land remains in the organisation's value chain. <p>An organisation may provide information additional to the IUCN Global Ecosystem Typology (GET) to define the type of ecosystem they refer to, such as regional or local classifications.</p> <p>Organisations should refer to other relevant TNFD sector guidance for ecosystem use change downstream, in particular the engineering, construction and real estate guidance.</p>	SASB EM-CM-160a.2. TNFD

16 When disclosing on ecosystem types, refer to the International Union for Conservation of Nature [Global Ecosystem Typology](#).

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C1.1	Extent of land/ freshwater/ ocean-use change	Extent of land/freshwater/ocean ecosystem conserved or restored (km ^{2s}), split into: <ul style="list-style-type: none"> • Voluntary; and • Required by statutes or regulations. 	<p>In reporting this core global disclosure metric, an organisation should distinguish between extent conserved and restored:</p> <ul style="list-style-type: none"> • In areas owned, leased or managed; and • In areas off-site, owned, leased or managed by other organisations. <p>An organisation should also report land that is temporarily restored and any temporary habitats created.</p> <p>An organisation should report area conserved and restored separately.</p>	GRI 101-6 SASB EM-CM-160a.2.
C1.1	Extent of land/freshwater/ ocean-use change	Extent of land/freshwater/ocean ecosystem that is sustainably managed ¹⁷ (km ²) by: <ul style="list-style-type: none"> • Type of ecosystem;¹⁸ and • Type of business activity. 	No further sector specific guidance. Refer to the core global metric guidance.	TNFD

¹⁷ See the [TNFD Glossary](#) for a definition of “sustainably managed”.

¹⁸ When disclosing on ecosystem types, refer to the International Union for Conservation of Nature [Global Ecosystem Typology](#).

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C2.0	Pollutants released to soil split by type	Pollutants released to soil (tonnes) by type, referring to sector-specific guidance on types of pollutants.	In reporting this core global disclosure metric, an organisation should include pollutants released to soil that include any cement kiln dust, metal pollutants (mercury (Hg), cadmium (Cd), thallium (Tl), antimony (Sb), arsenic (As), lead (Pb), chromium (Cr), cobalt (Co), copper (Cu), manganese (Mn), nickel (Ni), zinc (Zn) and vanadium (V)), toxins and any other types of soil pollutants released by the organisation.	ENCORE TNFD
C2.1	Wastewater discharged	Volume of water discharged (m ³), split into: <ul style="list-style-type: none"> • Total; • Freshwater; and • Other.¹⁹ Including: <ul style="list-style-type: none"> • Concentrations of key pollutants in the wastewater discharged, by type of pollutant, referring to sector-specific guidance for types of pollutants; and • Temperature of water discharged, where relevant. 	In reporting this core global disclosure metric, water discharged should be broken down by destination: <ul style="list-style-type: none"> • Surface water; • Groundwater; • Seawater; and • Third-party water, and the volume of this total sent for use to other organisations. As well as broken down by source: <ul style="list-style-type: none"> • Point source discharge; and • Non-point source discharge. 	GRI 303-4 SASB EM-CM-140a.1. TNFD

			<p>For each site, an organisation should consider disclosing the following pollutants:</p> <ul style="list-style-type: none"> • pH; • TSS (Total Suspended Solids); • TDS (Total Dissolved Solids); • Metal pollutants (mercury (Hg), cadmium (Cd), thallium (Tl), antimony (Sb), arsenic (As), lead (Pb), chromium (Cr), cobalt (Co), copper (Cu), manganese (Mn), nickel (Ni), zinc (Zn) and vanadium (V)); • TPH (Total Petroleum Hydrocarbons); and • BOD (Biochemical Oxygen Demand). <p>An organisation should describe the methodology used to calculate said concentrations as well as the dates and/or frequency of measurement for each pollutant, and whether the emission is a one-off occurrence or continuous.</p>	

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C2.2	Waste generation and disposal	<p>Weight of hazardous and non-hazardous waste generated by type (tonnes), referring to sector-specific guidance for types of waste.</p> <p>Weight of hazardous and non-hazardous waste (tonnes) disposed of, split into:</p> <ul style="list-style-type: none"> • Waste incinerated (with and without energy recovery); • Waste sent to landfill; and • Other disposal methods. <p>Weight of hazardous and non-hazardous waste (tonnes) diverted from landfill, split into waste:</p> <ul style="list-style-type: none"> • Reused; • Recycled; and • Other recovery operations. 	<p>Types of waste to report under this core global disclosure metric include:</p> <ul style="list-style-type: none"> • Slags; • Dusts; • Sludges; • Used oil; and • Other solid wastes that meet the TNFD definition of waste. <p>The scope excludes gaseous waste.</p>	<p>SASB EM-CM-150a.1.</p> <p>TNFD</p>

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C2.3	Plastic pollution	<p>Plastic footprint as measured by total weight (tonnes) of plastics (polymers, durable goods and packaging) used or sold broken down into raw material content.²⁰</p> <p>For plastic packaging, percentage of plastics that is:</p> <ul style="list-style-type: none"> • Reusable; • Compostable; • Technically recyclable; and • Recyclable in practice and at scale. 	No further sector specific guidance; refer to the core global disclosure metric.	TNFD

²⁰ Raw material content: % of virgin fossil-fuel feedstock; % of post-consumer recycled feedstock; % of post-industrial recycled feedstock; % of virgin renewable feedstock.

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C2.4	Non-GHG air pollutants	<p>Non-GHG air pollutants (tonnes) by type:</p> <ul style="list-style-type: none"> • Particulate matter PM_{2.5} and/or PM₁₀; • Nitrogen oxides (NO₂, NO and NO₃); • Volatile organic compounds (VOC or NMVOC); • Sulphur oxides (SO₂, SO, SO₃, SO_x); and • Ammonia (NH₃). 	<p>Additional pollutants to report under this core global disclosure metric include:</p> <ul style="list-style-type: none"> • Carbon monoxide (CO); • Dioxins/furans, including but not limited to the sum of the 17 congeners of polychlorinated dibenzodioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) that contain chlorine; and • Heavy metals (includes mercury (Hg), cadmium (Cd), thallium (Tl), antimony (Sb), arsenic (As), lead (Pb), chromium (Cr), cobalt (Co), copper (Cu), manganese (Mn), nickel (Ni) and vanadium (V)); and • Airborne dust. 	<p>GCCA (2019) GRI G4 Construction and real estate EN8, EN9 SASB EM-CM-120a.1.</p>

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C3.0	Water withdrawal and consumption from areas of water scarcity	Water withdrawal and consumption ²¹ (m ³) from areas of water scarcity, including identification of water source. ²²	<p>In reporting this core global disclosure metric, an organisation should include:</p> <ul style="list-style-type: none"> • Total freshwater (≤ 1000 mg/l of Total Dissolved Solids) withdrawal, including from natural open sources such as rivers, lakes, natural ponds, streams, creeks; from groundwater (wells, boreholes, water below soil surface); from municipal and/or from third parties; and from quarry dewatering used in operations; • Total non-freshwater (> 1000 mg/l of Total Dissolved Solids) withdrawal, including from sources of high salinity or pollutants; and • Harvested rainwater: Volume of precipitation (rainwater or snowmelt) that is collected on-site (e.g. settling ponds, inactive quarry area that has not yet reached the groundwater table). <p>Water from quarry dewatering that is not used should be reported separately.</p> <p>An organisation should differentiate withdrawal from groundwater sources that are recharged and non-recharged.</p>	GRI 303-3 TNFD

²¹ Water consumption is equal to water withdrawal less water discharge. Reference: GRI (2018) [GRI 303-5](#).

²² Surface water; groundwater; seawater; produced water; third-party water. Reference: GRI (2018) [GRI 303-3](#).

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C3.1	Quantity of high-risk natural commodities sourced from land/ocean/freshwater	Quantity of high-risk natural commodities ²³ (tonnes) sourced from land/ocean/freshwater, split into types, including proportion of total natural commodities.	<p>Commodities to report under the core global disclosure metric include:</p> <ul style="list-style-type: none"> • Alumina and ferrous oxide; • Chalk marl; • Coal; • Limestone; • Natural gypsum; • Pozzolan; • Primary aggregates; • Sand; and • Silica correctives. <p>In the core global metric, ‘sourced’ should be interpreted as purchased, bought by an organisation or from its own supply.</p>	<p>GRI G4 Construction and real estate EN1</p> <p>SBTN (2023)</p> <p>TNFD</p>

²³ Users should refer to the Science Based Targets Network (SBTN) [High Impact Commodity List \(HICL\)](#), species listed as vulnerable, endangered or critically endangered on the [IUCN red list](#), and species listed in [appendices I, II and III to CITES](#).

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C3.1	Quantity of high-risk natural commodities sourced from land/ocean/freshwater	Quantity of high-risk natural commodities ²⁴ (tonnes) sourced under a sustainable management plan or certification programme, including proportion of total high-risk natural commodities.	<p>Commodities to report under the core global disclosure metric include:</p> <ul style="list-style-type: none"> • Alumina and ferrous oxide; • Chalk marl; • Coal; • Limestone; • Natural gypsum; • Pozzolan; • Primary aggregates; • Sand; and • Silica correctives. <p>In the core global metric, ‘sourced’ should be interpreted as purchased or bought by an organisation or from its own supply.</p>	<p>GRI G4 Construction and real estate EN1</p> <p>SBTN (2023)</p> <p>TNFD</p>
C4.0	Placeholder indicator: Measures against unintentional introduction of invasive alien species (IAS) ²⁵	Proportion of high-risk activities operated under appropriate measures to prevent unintentional introduction of IAS, or low risk designed activities.	No further sector specific guidance; refer to the core global disclosure metric.	TNFD

²⁴ Users should refer to the Science Based Targets Network (SBTN) [High Impact Commodity List \(HICL\)](#), species listed as vulnerable, endangered or critically endangered on the [IUCN red list](#), and species listed in [appendices I, II and III to CITES](#).

²⁵ Due to the measurement of levels of invasive species for organisations being a developing area, the chosen indicator focuses on whether an appropriate management response is in place for the organisation. The additional sets of metrics contain measurement of the level of invasive species within an area. The TNFD intends to do further work with experts to define ‘high-risk activities’ and ‘low-risk designed activities’.

Metric no.	Core global indicator	Core global metric	Guidance for the sector	Source
C5.0	Placeholder indicator: Ecosystem condition	<p>For those organisations that choose to report on state of nature metrics, the TNFD encourages them to report the following indicators, and to refer to the TNFD additional guidance on measurement of the state of nature in Annex 2 of the LEAP approach:</p> <ul style="list-style-type: none"> • Level of ecosystem condition by type of ecosystem and business activity; and • Species extinction risk. 	No further sector specific guidance; refer to the core global disclosure metric.	TNFD
	Placeholder indicator: Species extinction risk	<p>There are a number of different measurement options for these indicators. The TNFD does not currently specify one metric as there is no single metric that will capture all relevant dimensions of changes to the state of nature and a consensus is still developing.</p> <p>The TNFD will continue to work with knowledge partners to increase alignment.</p>	No further sector specific guidance; refer to the core global disclosure metric.	TNFD

3.2. Core sector disclosure indicators and metrics

The TNFD core sector disclosure metrics for the construction materials sector are outlined below. The TNFD recommends that these metrics be disclosed by all report preparers in the sector on a comply or explain basis.

Table 14: Core sector disclosure indicators and metrics

Metric category	Metric subcategory	Metric No.	Indicator	Core sector metrics	Source
Impact driver	Land/freshwater/ocean-use change	CM.C1.0	Change in fragmentation due to linear infrastructure	<p>Length (km), footprint (km²), quantity (number) of lanes, planned traffic volume, and surface or material type of upgraded and/or new linear infrastructure (e.g. conveyors, roads, rails, powerlines, canals, pipelines, fences) built:</p> <ul style="list-style-type: none"> In sensitive locations, by sensitive location criteria met, stating the ecosystem type;²⁶ and In other areas, stating the ecosystem type. <p>Number of completed wildlife crossing structures or other fragmentation mitigation methods per kilometre of linear infrastructure, including:</p> <ul style="list-style-type: none"> Number with verified wildlife use; and Length, width and/or height (underpasses only) of crossing structures (m). <p>Crossing structures include underpasses, overpasses, canopy bridges. Other fragmentation mitigation efforts may include retrofits of existing culverts, fencing and jump-outs.</p>	TNFD
Impact driver	Pollution/pollution removal	CM.C2.0	Volume of spills	<p>Volume of spills of diesel, paints, solvents and toxic chemicals (m³), by national or company spill classification scheme and by type of ecosystem affected.</p>	ENCORE GRI 306-3

²⁶ See [TNFD Glossary](#) for the definition of sensitive location

3.3. Additional sector disclosure indicators and metrics

The TNFD additional sector disclosure metrics for the construction materials sector are outlined below. The TNFD encourages all report preparers in the sector to draw on these and any other relevant metrics where relevant to best represent an organisation’s material nature-related dependencies, impacts, risks and opportunities.

Table 15: Additional sector disclosure indicators and metrics

Metric category	Metric subcategory	Metric No.	Cross-sector indicator	Additional sector metrics	Source
Impact Driver	Pollution/pollution removal	CM.A2.0	Invasive alien species management	Area (km ²) controlled or managed by the organisation colonised by invasive alien species, by species type.	CEMBUREAU TNFD
Impact driver	Pollution/pollution removal	CM.A2.1	Light pollution	Contribution to light pollution, measured, for example, by: <ul style="list-style-type: none"> • Number and proportion (%) of outdoor lights by backlight, uplight and glare (BUG) rating; • Number and proportion (%) of outdoor lights above 2700K; • Total outdoor lighting (lumen and lumen/ha); • Total (m²) and proportion (%) of area with nighttime lighting; and/or • Number and proportion (%) of outdoor lights that are kept on at night; and number and proportion (%) of outdoor lights that are and are not dimmed at night, by degree of dimming. 	IUCN (2023) TNFD

Metric category	Metric subcategory	Metric No.	Cross-sector indicator	Additional sector metrics	Source
Impact driver	Pollution/pollution removal	CM.A2.2	Noise pollution	<p>Contribution to noise pollution, measured, for example, by:</p> <ul style="list-style-type: none"> • Average noise level and/or frequency (dB, Hz) across the 2-hour periods centred on sunrise and sunset before work on the site started (baseline), and during operations, on-site and/or in the nearest noise-sensitive habitat to the most significant noise source; and/or • Average noise level and/or frequency across the day (dB, Hz), before the work on the site started (baseline), and during operations, on-site and/or in the noise-sensitive habitat nearest the most significant noise source; and/or • Average noise level and/or frequency (dB, Hz) before work on the site started (baseline) and at the noisiest period of the day during the operations, on-site and/or in the noise-sensitive habitat nearest the most significant noise source; and/or • Number of incidents where noise level exceeded local regulatory or international standards. 	GRI 101 TNFD
Impact driver	Resource use/replenishment	CM.A3.0	Water replenishment	Total volume of water (m ³) that has been sustainably supplied, purified and/or conserved in the same watershed where the freshwater was withdrawn. This includes volume of water from watershed protection and restoration projects, from water access and sanitation to community projects and from water efficient agriculture and water efficient irrigation practices.	TNFD

Metric category	Metric subcategory	Metric No.	Cross-sector indicator	Additional sector metrics	Source
Response	Dependency, impact, risk and opportunity management: Changes to nature (dependency and impact): mitigation hierarchy steps	CM.A23.0	Circularity of material use	<p>Proportion (%) of all material inflows that are regeneratively produced.</p> <p>Proportion (%) of materials used that are recycled and reused input materials by significant categories of raw materials, renewable materials and manufactured products.</p> <p>Proportion (%) of total mass of materials, products and components/ systems used that have been reused, repurposed or remanufactured, either from existing infrastructure on-site being demolished, refurbishment, fit-out or from other buildings, third parties etc.</p>	<p>GRI G4 Construction and real estate EN2</p> <p>UK Green Building Council (2023)</p> <p>Ellen MacArthur Foundation (2020) Indicator 6a.</p>
Response	Dependency, impact, risk and opportunity management: Value chain	CM.A22.0	Value chain certification	Proportion (%) of materials sold for which there is an Environmental Product Declaration (EPD) meeting any applicable industry standards.	TNFD
